

### ABSTRACT

An oral treatment/care agent including the combination of one or more of an oral bacterial flora-controlling agent that will restore abnormal or sick oral bacteria flora to a normal or healthy oral bacterial state and a periodontal-pocket bacterial flora-controlling agent that will eliminate or convert the bacteria, fungi, viruses and other microbes in a periodontal pocket into a group of symbiotic bacteria. This agent is capable of preventing diseases of the oral tissue and is effective in stopping or slowing the development of a disease in progress.
